## a

---

```
for t_ = t
    %update function f at this time step
    f = cos((omega.*t_)-(k.*z));
    figure(1)
    cla()
    plot(z,f)
    xlim([min(z),max(z)])
    ylim([-1,1])
    xlabel('z')
    ylabel('f(z,t)')
    drawnow()
end
% omega changes how fast the function oscillates
% k determines how far the wave travels
```

**b**

```
for t_ = t
    %update function f at this time step
    f = cos((omega.*t_)+(k.*z));
    figure(2)
    cla()
    plot(z,f)
    xlim([min(z),max(z)])
    ylim([-1,1])
    xlabel('z')
    ylabel('f(z,t)')
    drawnow()
end
% omega changes how fast the function oscillates
% k determines how far the wave travels
```

**c**

```
alpha = 2;
for t_ = t
    %update function f at this time step
    f = (exp(-1*alpha*z)).*cos((omega.*t_)-(k.*z));
    figure(3)
    cla()
    plot(z,f)
    xlim([min(z),max(z)])
    ylim([-1,1])
    xlabel('z')
    ylabel('f(z,t)')
    drawnow()
end
% omega changes how fast the function oscillates
% k determines how far the wave travels
% alpha determines what is happening at time = 0
```

d

```
A = 2;
B = 2;
for t_ = t
    %update function f at this time step
    f = A.*cos((omega.*t_)-(k.*z)) + B.*cos((omega.*t_)+(k.*z));
    figure(4)
    cla()
    plot(z,f)
    xlim([min(z),max(z)])
    ylim([-1,1])
    xlabel('z')
    ylabel('f(z,t)')
    drawnow()
end
% omega changes how fast the function oscillates
% k determines how far the wave travels
% A and B determines the size of the amplitude of the waves
```
